Agentic Error Remediation for Express

Adobe

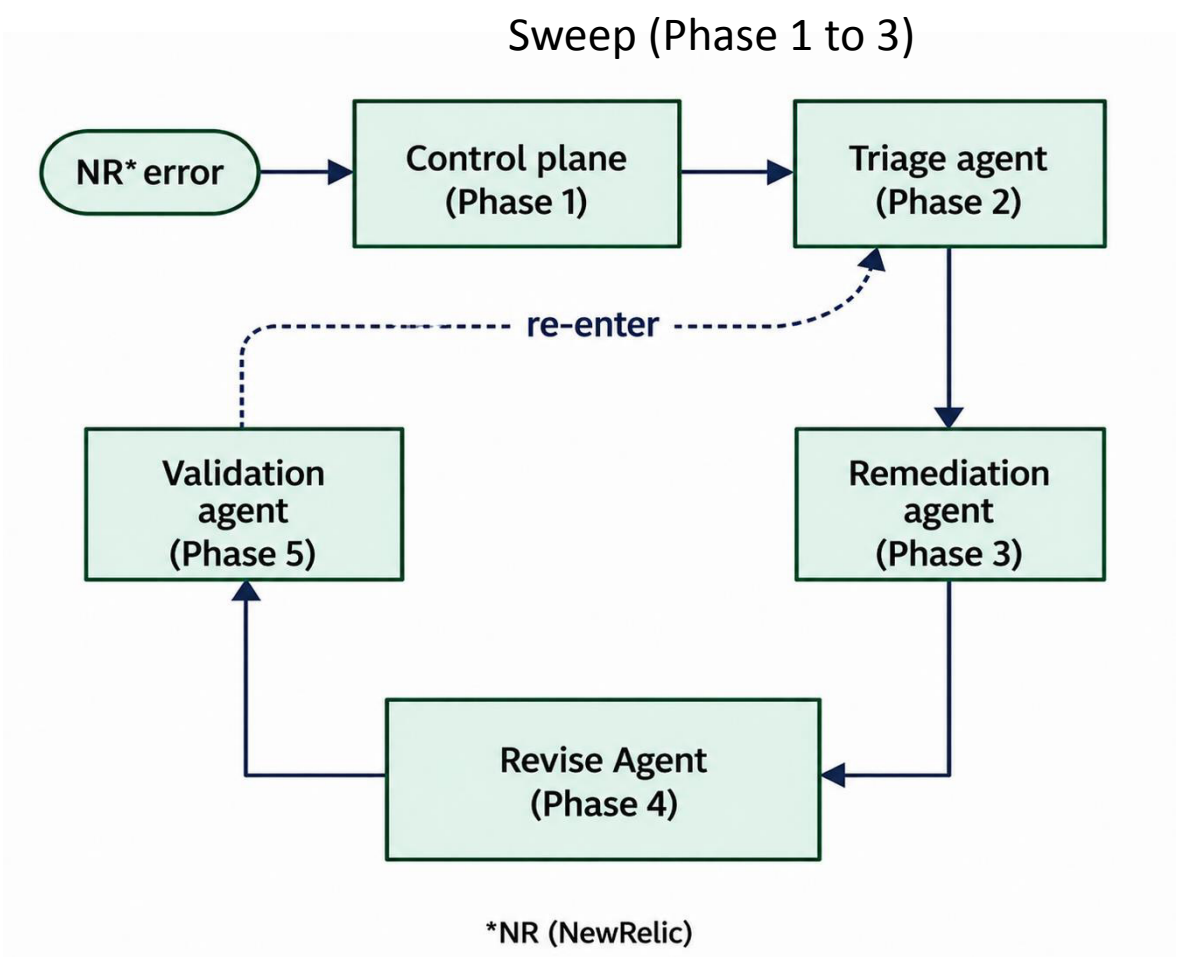

PROBLEM

- Production JS errors on Express land continuously
- Logged in New Relic (client-fatal + non-fatal) and cross-referenced in Splunk
- Today: a human walks the full relay, per error
- At real volume, most errors never get this attention

Solution at a glance

- Autonomous agentic pipeline runs the same 7-step relay end-to-end
- Human only in the loop at final review + merge

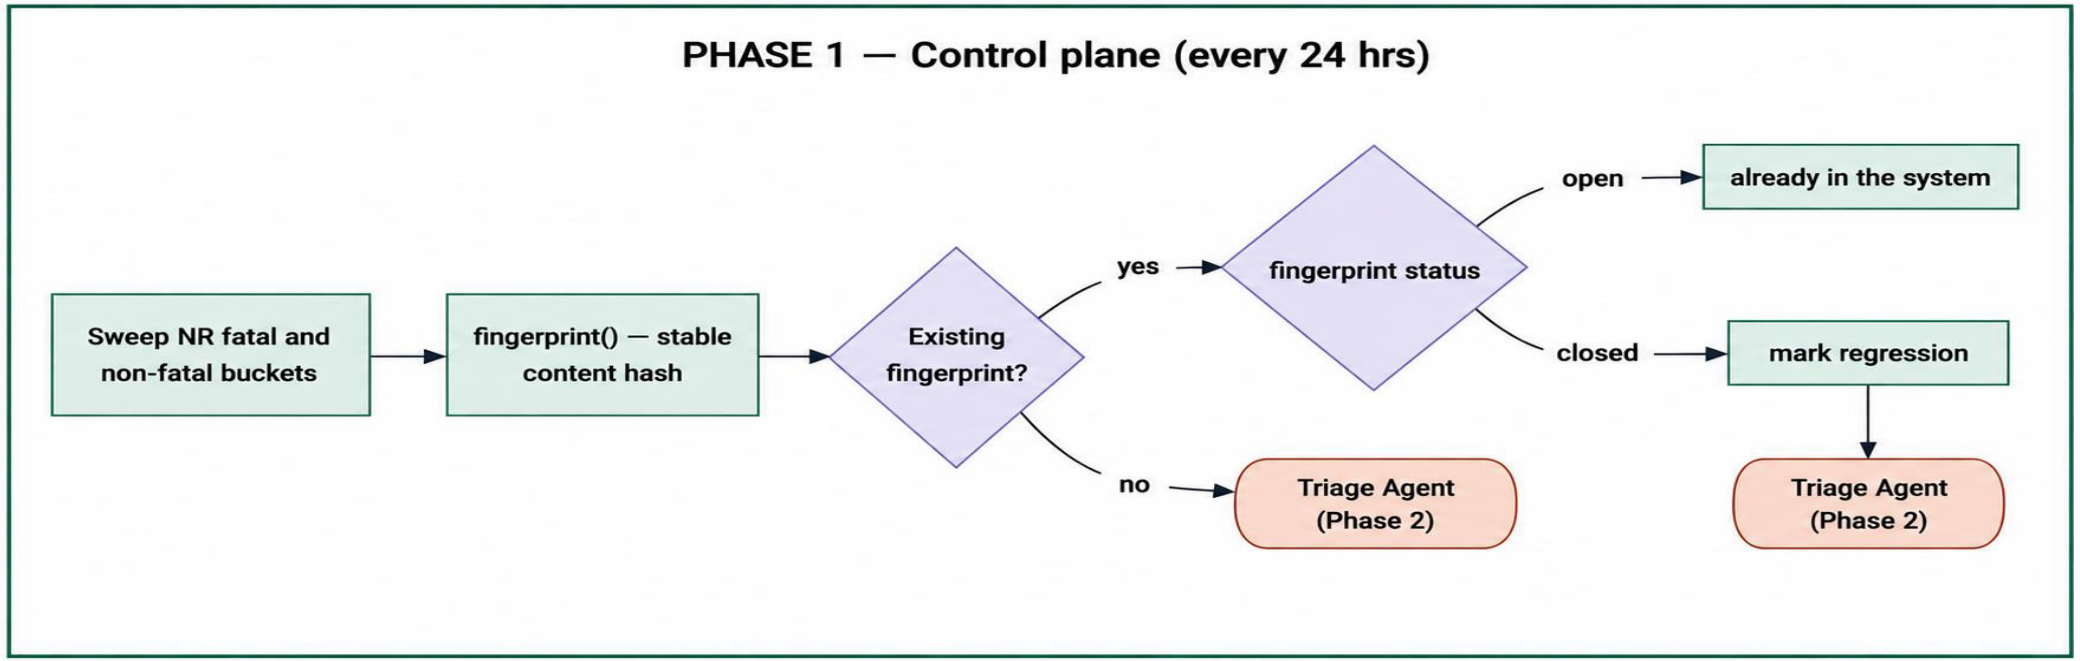

Before / After

Manual today	Automated by Agents
Spot the critical error	Ranked + fingerprinted every sweep
Check Jira for existing work	Dedup + state lookup
Triage & assign to a team	Classified + filed automatically
Find, fix, test, open a PR	Sandboxed fix + PR
Babysit the PR through review	Agent replies + revises

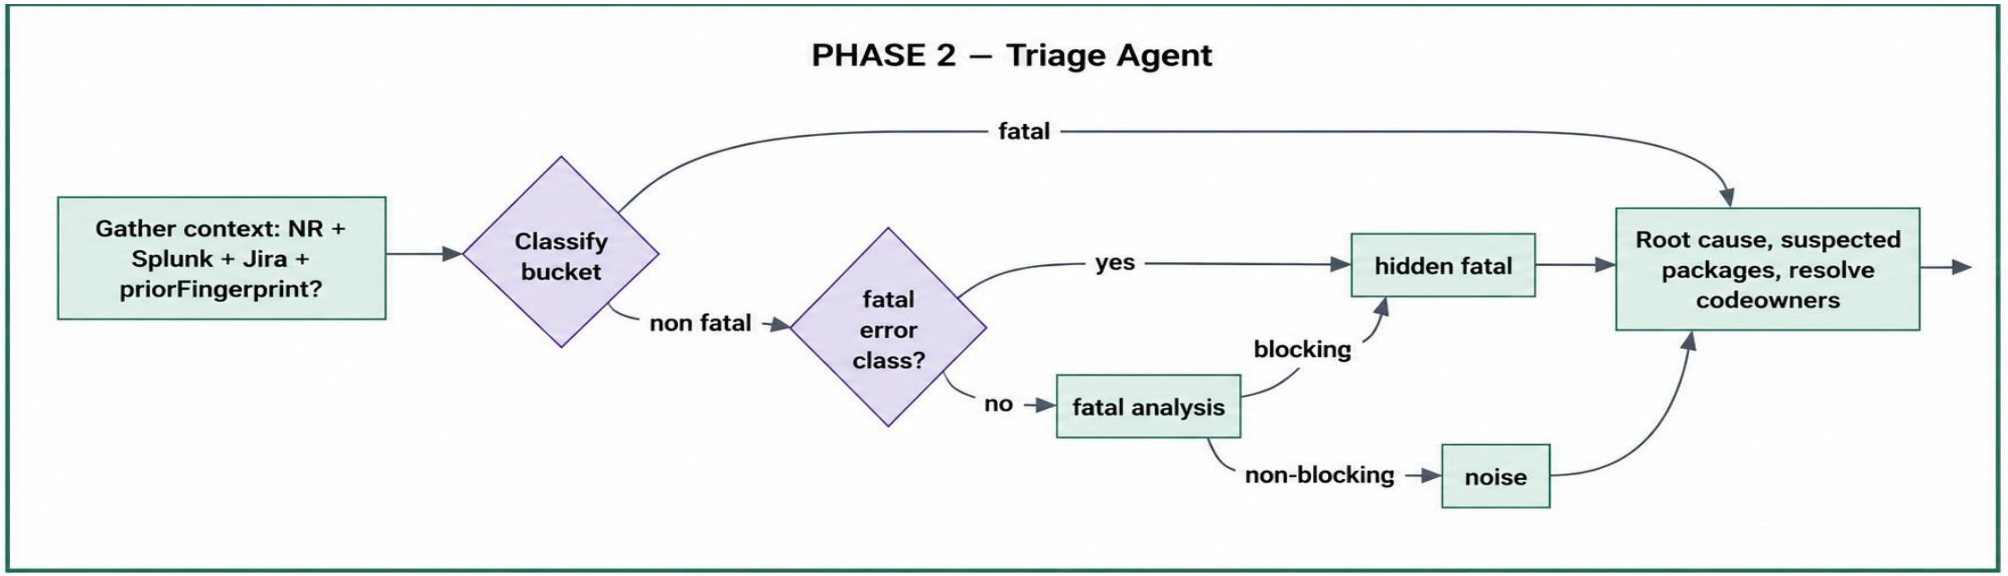

CONTROL PLANE

- Sweeps New Relic every cycle — top fatal + non-fatal errors
- Ranked by volume + sessions affected
- Builds a stable fingerprint per error
- Checks against pipeline state — new vs. already tracked

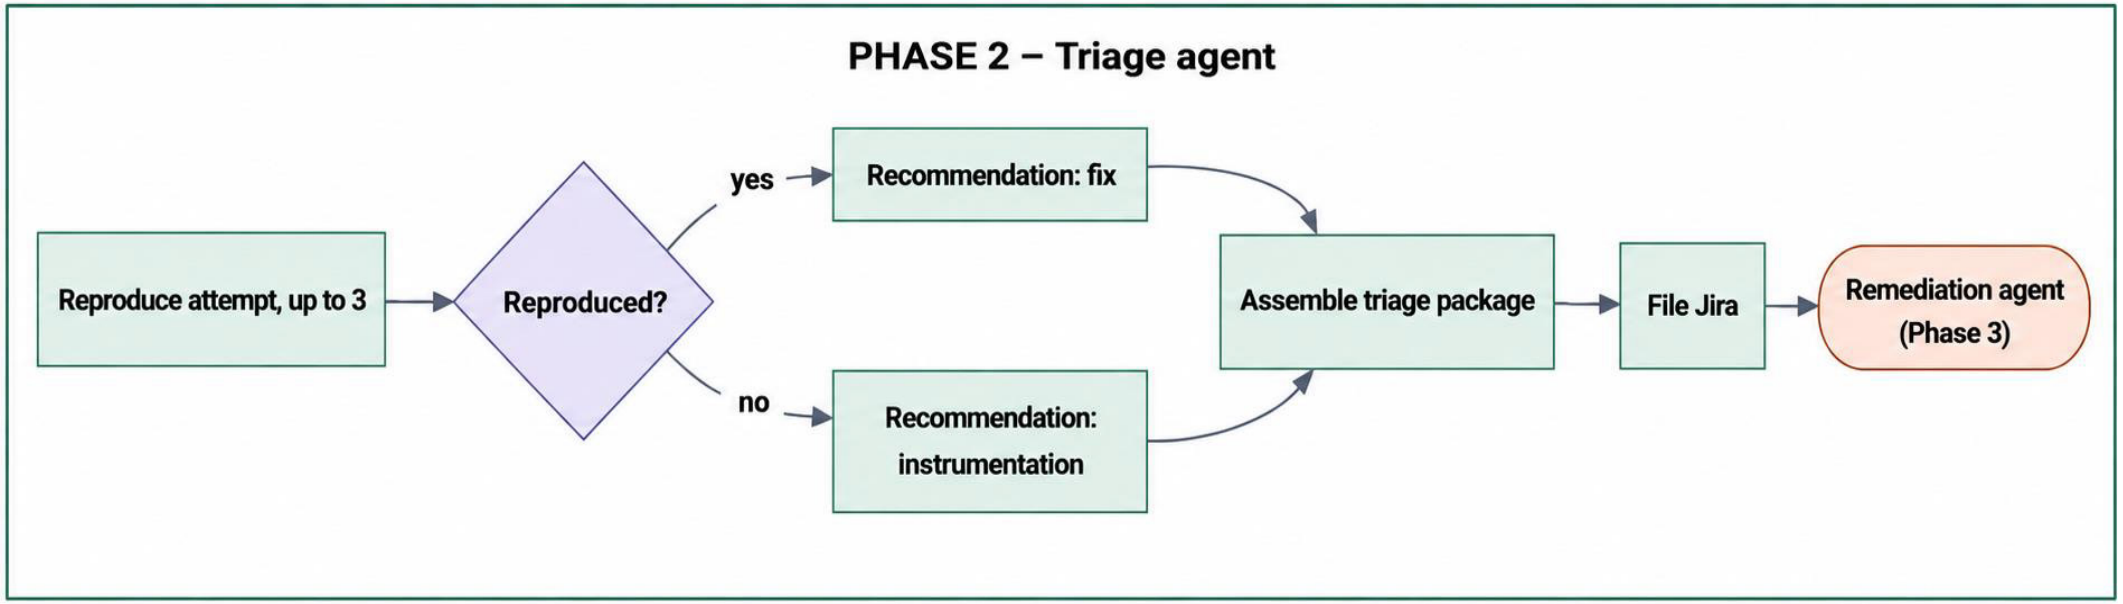

TRIAGE AGENT (bucketisation & root cause investigation)

- Gather context : New Relic + Splunk + Jira + priorFingerprint
- Classifies each error: fatal / hidden-fatal / noise
- Derives root cause, suspect files, code owners

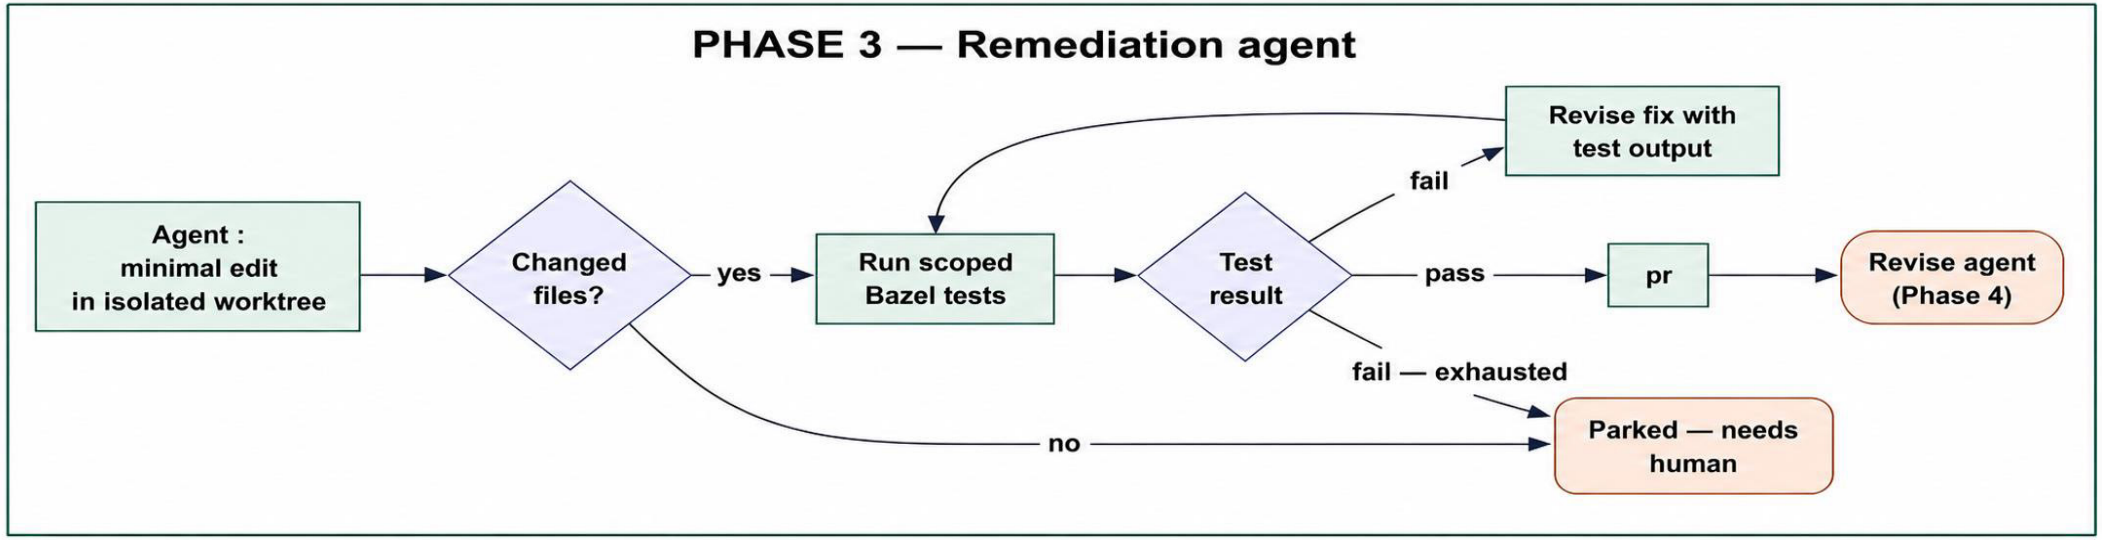

TRIAGE AGENT – reproduction & instrumentation

- Error reproduction attempt against the breadcrumb trail + stack trace + user session data
  - Reproduced → Fix
  - Not reproduced → observability instrumentation + Fix
- Triage Package (essential data for remediation agent)
- Files Jira ticket

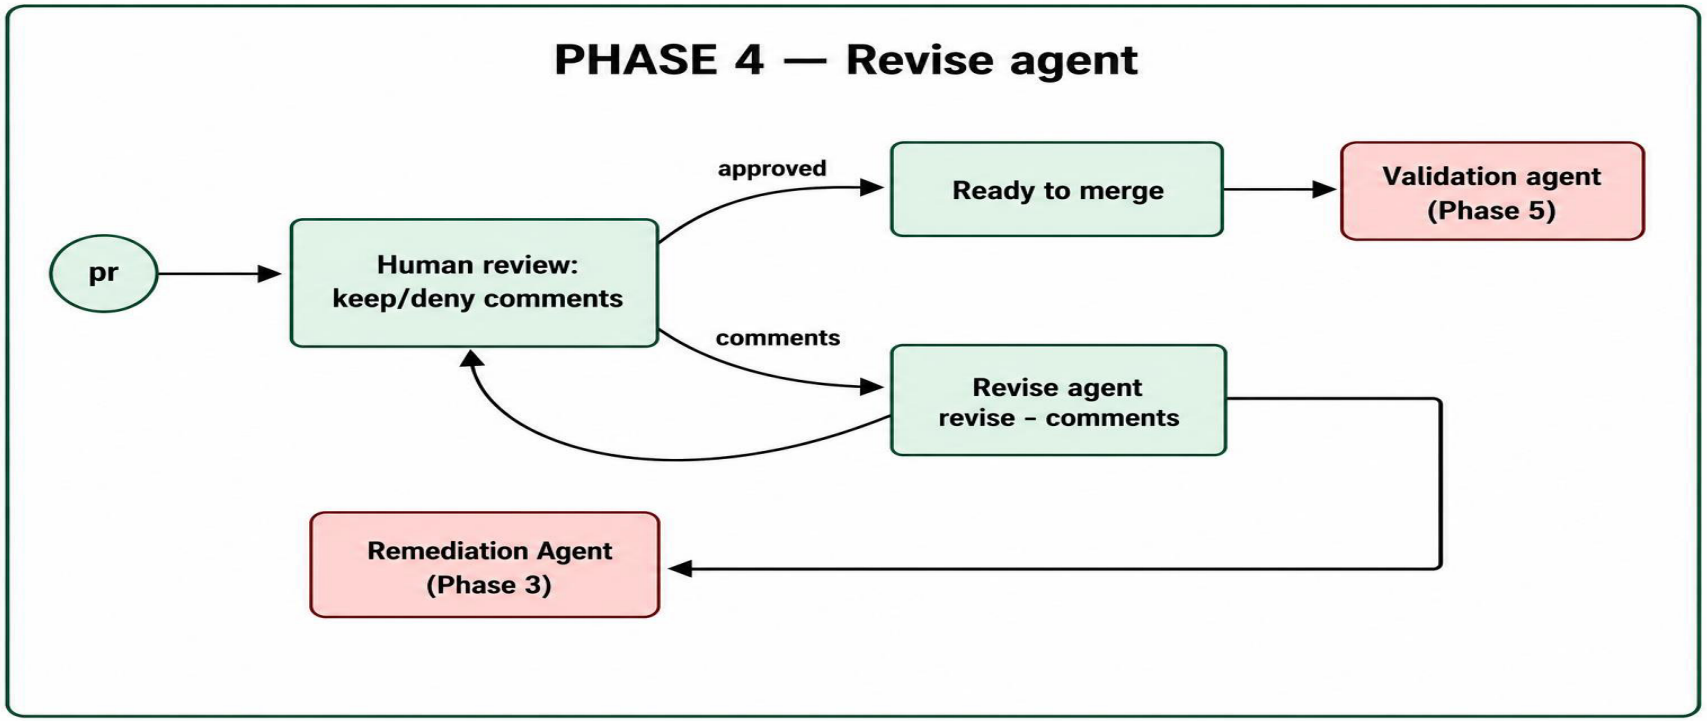

REMEDIATION AGENT

- Remediation agent edits in an isolated git worktree
- Runs scoped Bazel verification
- Revises on failure
- Opens a PR — or parks for a human if it can't land a fix

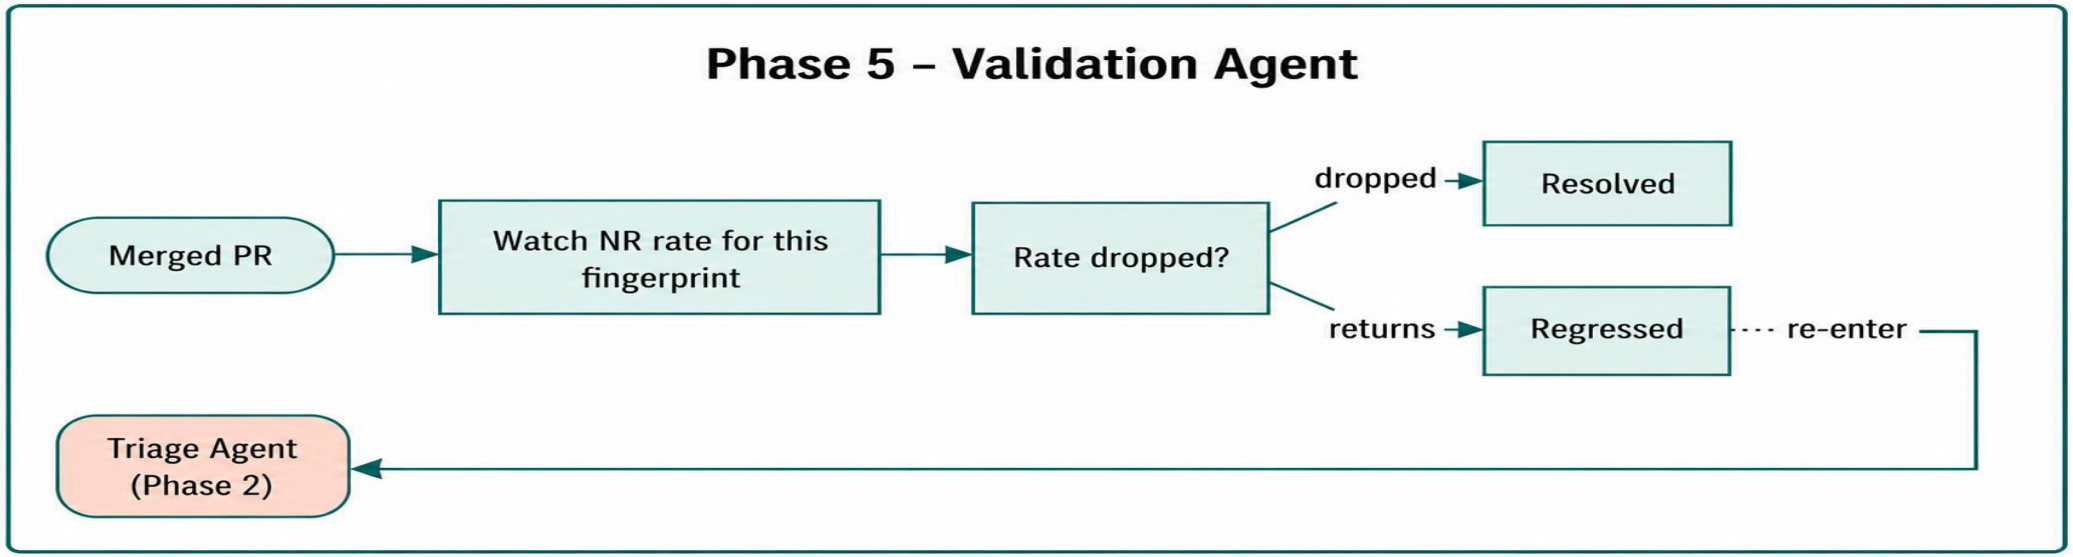

REVISE AGENT

- Human reviews the PR
- Revise agent does conversation with the reviewer and take actions like replying comments or revising the fix
- Human owns merge — always

VALIDATION AGENT

- Watch NR error rate for merged fingerprint
- Mark resolved or regressed
- Re-enter triage on regression

CHALLENGES

- Learning Curve (Horizon, New Relic, LangGraph, Claude Agent SDK, Playwright, etc.)
- Multiple Runs, One Working Directory
- Error Reproduction
- Syncing with the Latest Changes
- Context Sharing Between Agents

Q&A
